Block & Brick Laying Mortar Adhesive

Description
Dr. Fixit Unifix DRT 1001 is a ready mix mortar that requires only the addition of water. It is composed of organic & hydraulic binders, graded sand & additive. It is a premium grade dry thin adhesive used for laying / fixing regular block and other masonry units because it provides strong adhesion in thin film, it is easy to apply with improved workability & negligible shrinkage.

Standard Compliance / Specification
- Meets the requirement of ASTM C 270 for Type N mortar.

Typical Applications
- Fixing of blocks, stone and bricks.

Features
- Quality - Pre-packed quality controlled premixed mortar.
- Suitability - Specially formulated for Middle East climatic conditions.
- Adhesion - Polymer modified formulation ensures excellent adhesion to prepared substrates.
- Thin layer adhesion - Excellent adhesion with thin joint application.
- Ease of application - Convenient and easy to apply.
- Workability - Improves workability.
- Water resistant - Good resistance to water after curing.
- Economical - Highly cost effective
- Shrinkage - Negligible shrinkage.

Packaging
50 kg bag

Method of Application

1. Surface Preparation
- The surface should be sound, clean, and free from dirt, oil or grease.
- The surface should be free from loosely adhered materials.
- The regular blocks / bricks should be cleaned using a brush to remove any dust or loose particles.
- The suction of the blocks should be neutralized by applying clean potable water on them.
- Free water on the surface should be allowed to disperse prior to the application.

2. Mixing
- Mix 25 kg of Dr. Fixit UniFix DRT 1001 with 8.0 to 9.0 liters of water in a clean container to a uniform lumps free consistency with a mechanical mixer.
- For best results, use a mechanical mortar mixer and mix thoroughly until all material is wet and of a smooth plastic consistency.
- Allow it to stand for 5 minutes, so that the resins are completely dissolved.
- Addition extra water to the mortar after initial mixing is not recommended.
- Material which has begun to harden or is caking should not be used.
- Moisten the surface with water before the application.
3 APPLICATION
Apply a full mortar bed on the clean foundation, footing or ledge and carefully place the block into the setting bed before the mortar begun to harden.

- In order to get uniform thickness of the mortar, comb it with a serrated trowel before placing the block on it.
- Lightly tap the block in place using the handle of the trowel. This assures good contact between the blocks and the mortar.
- Push masonry blocks into mortar to form uniform vertical joint with minimum gap.
- Point all the horizontal joints when mortar has set to thumb print hard.
- When placing consecutive courses, remove the excess mortar with a quick striking motion of the trowel.
- Ideal application temperature is between +5°C and +35°C.

4 CURING
- The applied mortar adhesive has to be cure 3-4 times a day for at least 3 days by spraying with water. Protect the newly applied material from sunshine and wind.

Yield
A 50 kg bag = 27 liters approx. of fresh of fresh mortar

Shelf Life
Shelf life is 6 months from the date of manufacturing in unopened conditions. Store in a shaded area at dry condition away.

Health and Safety
- Cementitious mortars and slurries, when mixed with water, release alkalies which can be harmful to the skin. Protective clothing, such as gloves and goggles, should be worn (see packaging for specific instructions).
- During use, avoid inhalation of dust and contact with skin and eyes.
- In case of contact with skin, rinse with plenty of clean water then cleanse with soap and water.
- In case of contact with eyes, rinse immediately with plenty of clean water and seek medical advice.
- Should any of the products be accidentally swallowed, do not induce vomiting but call for medical assistance immediately.
